

Charging your Cell Phone from a Car Battery

Power outages can happen at any time; don't be caught off-guard. Battery banks are great but usually only supply a few charges before they are depleted. A vehicle battery is a powerful source of energy, if/when needed. One vehicle battery, and the devices below, could support several households in keeping their devices charged for some time.

- A healthy car battery should be able to completely charge a cell phone 20 to 30 times **and still be able to start the vehicle**. More here... <https://homebatterybank.com/how-many-times-can-a-car-battery-charge-a-phone/>
- The devices below allow you to harness the energy stored in the battery without wasting power energizing the entire vehicle.

NOTE: If you choose a different model of battery clamp, make sure it has at least a **12 AWG** (American Wire Gauge). Or a lower AWG. The lower the number, the thicker the wire, and the higher the load (of electricity) it can handle without overheating.
